

Live Scoring for vMix and the Production Team

One control point. Rules-compliant scoring. Two live output channels.

The Main Form manages players and the current production context

fennis26 1.0.1.6 | Peter Aellig

Sponsor

The scorer populates and switches the titles using SetText and overlay commands.

Tennis26 and Python run in parallel with clearly separated responsibilities

08

Tennis26 writes the live state and controls vMix. The separate Python application reads the file and provides JSON and HTML over the network.

The Python application extends Tennis26 without blocking the scorer

09

TENNIS26 · VB.NET

- Captures points and players
- Calculates rules and statistics
- Controls vMix via HTTP/TCP
- Writes tennis24_live.json
- Updates heartbeat data

PYTHON · FLASK

- Runs in parallel as a separate process
- Reads and validates the JSON file
- Provides /api/live and JSON
- Builds the commentator HTML page
- Monitors freshness and heartbeat

A failure or restart of the web extension does not affect the core scoring and vMix functions.

10

Live: <http://<LAN-IP>:42100/>

The JSON feed is an open interface for additional display systems

11

Any product that can read HTTP JSON can use the same live state, independently of vMix and the commentator page.

Live operation includes error handling and recovery

12

RESPONSIVENESS

A persistent TCP connection avoids an HTTP handshake for every command.

FAILOVER

The HTTP and TCP senders share the same interface and remain interchangeable.

SAFETY

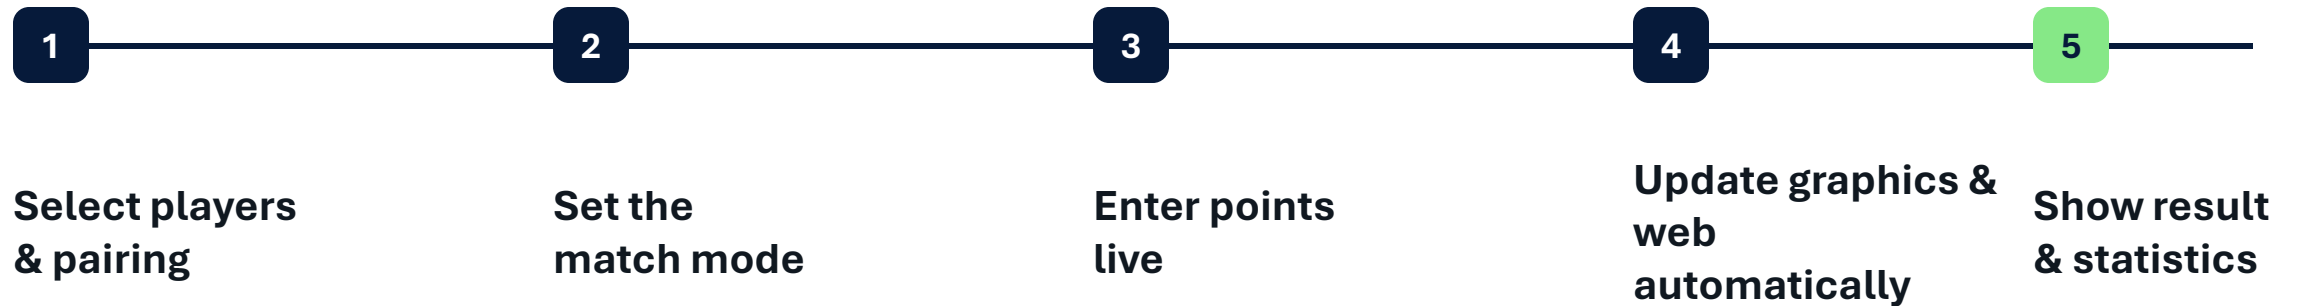

The undo stack, save/load, and recovery protect against operator errors and restarts.

DATA QUALITY

Flask validates JSON, checks file age and heartbeat, and returns clear HTTP errors.

The production workflow stays linear from pairing to final result

13

The operator focuses on the match while technical distribution runs in the background.

One scorer for the entire live production system

1

Operator
